Alcohol Use Screening and Assessment

By: Madeline A. Naegle APRN-BC, PhD, FAAN

WHY: While as many as 60% of older persons abstain from alcohol use, drinking problems are the largest category of substance abuse problems in older adults. Alcohol consumption is associated with high morbidity and mortality in middle age adults and the vulnerability of older adults to the effects of alcohol, alone and in combination with multiple co-morbidities, increases the risk for immediate and long-term harm. The National Institute of Alcohol Abuse and Alcoholism recommends that alcohol consumption for adults 65 and older be limited to 1 standard drink (12 oz. beer, 4-5 ounces of wine or 1½ ounces of distilled spirits) per day or seven standard drinks per week.

BEST TOOL: The Short Michigan Alcoholism Screening Instrument – Geriatric Version was developed as the first short-form alcoholism screening instrument for the elderly. A score of 2 or more “yes” responses suggests an alcohol problem.

TARGET POPULATION: Older adults who are regular users of alcohol in any amount. The goal of screening is to identify an “at risk” population of persons drinking at levels linked with negative outcomes for physical and mental health such as stroke, depression and gastrointestinal problems. Older persons taking prescription medications are at greater risk.

VALIDITY/RELIABILITY: The MAST-G, the original instrument from which this measure was derived, has a sensitivity of 93.9%, specificity of 78.1%, a positive predictive value of 87.2% and a negative predictive value of 88.9%.

STRENGTHS AND LIMITATIONS: The instrument serves as a screening tool only. A more comprehensive assessment for alcohol/drug dependence requires that the clinician inquire about the quantity and frequency of use, and the negative social and health consequences of each drug used, including nicotine, prescription, over- the- counter, recreational drugs and alcohol.

FOLLOWUP: Brief interventions by health care providers with older adults who are drinking at higher levels have been shown to be useful in reducing alcohol consumption by older adults. Nurses in all health care settings serving adults over 60 should screen for excess alcohol use.
